Cell doubled (m=2): two-factor explanation and its remainder
A. Filter strength changes with scale
x2
x3
x4
x6
Fitted transfer w
Output frequency r (cycles / HR pixel)
B. Proxy coverage depends on scale
Measured cost D
Recovery-filter proxy Q
Q/D=0.44
Q/D=0.72
Q/D=0.81
Q/D=2.50
RGB MSE cost (x 1e-6)
Upsampling scale
C. DIV2K: exact accounting of the decrease
Recovery R
Filter w
Error correlation G
Non-scalar remainder H
Share of measured MSE-cost decrease (%)
2 to 3
3 to 4
4 to 6
2 to 6
D. Set14: x2 to x6, image-bootstrap 95% CI
Share of measured decrease (%)
R
w
G
H
0 < r < 0.5; H includes residual energy and its correlation with native error. Shares are descriptive MSE accounting.
